

This webinar will cover:

- 1) How breast cancer treatment can impact subsequent fertility due to chemotherapy related toxicity to the ovaries and delay in childbearing.
- 2) How the amount of time from diagnosis and treatment before attempting pregnancy depends on the treatments used.
- 3) How breast cancer treatment does not appear to increase the risks of congenital abnormalities or birth defects in babies.
- 4) How pregnancy does not appear to compromise survival in women who are healthy enough to conceive and carry a pregnancy.

**Dr. Eric Heegaard** is a Minnesota based Gynecologic surgeon whose surgical practice has been on the forefront of minimally invasive gynecology for over a decade. His expertise also includes treatment of endometriosis, fibroids, infertility, bladder incontinence, pelvic floor prolapse, and cosmetic gynecology. [More on Dr. Heegaard](#)
